Folder Track

Folder Tracks allow for the organization of your tracks within Sequencer's Outliner.

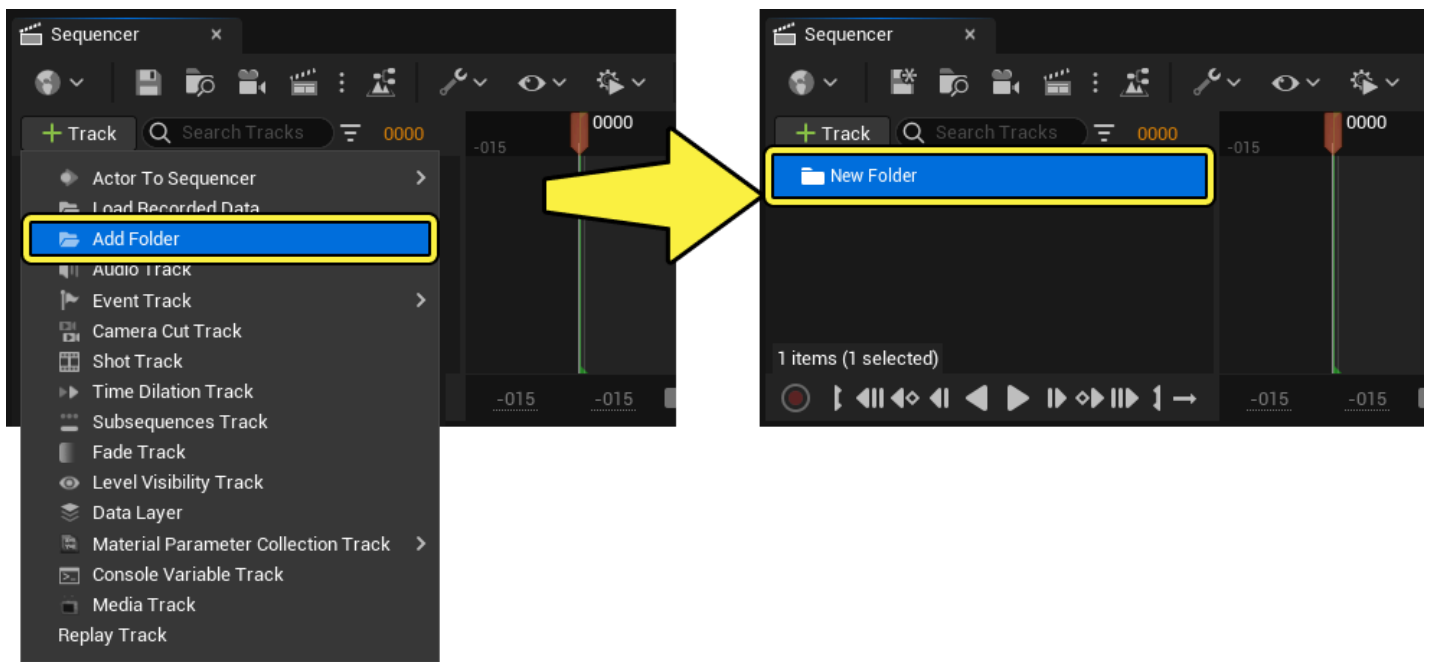

Folder tracks in Sequencer are used to organize your content and other tracks within custom folders. This page provides an overview of how to create and use Folder tracks.

Prerequisites

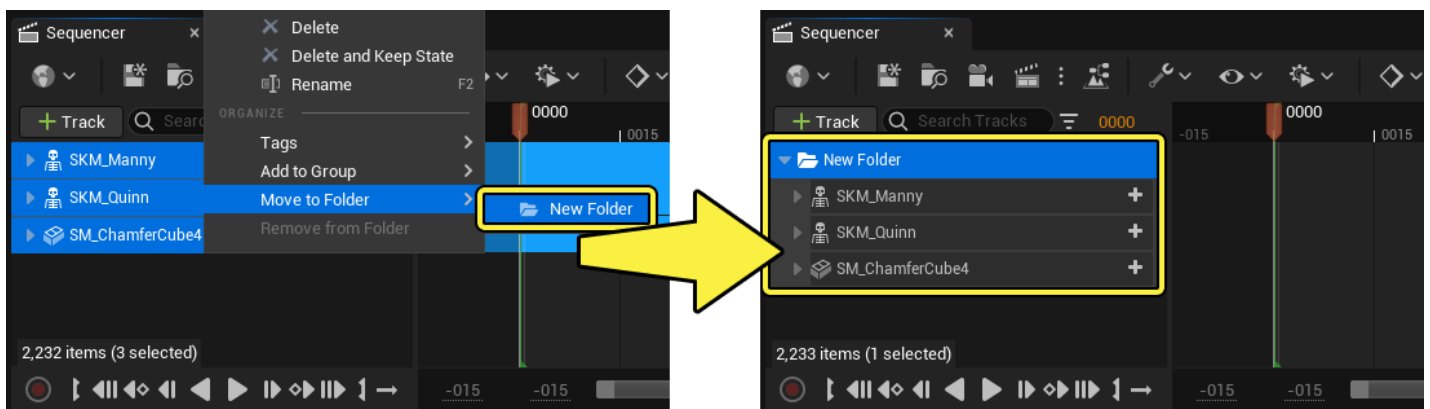

- You have an understanding of [Sequencer](#) and its [Interface](#).

Creation

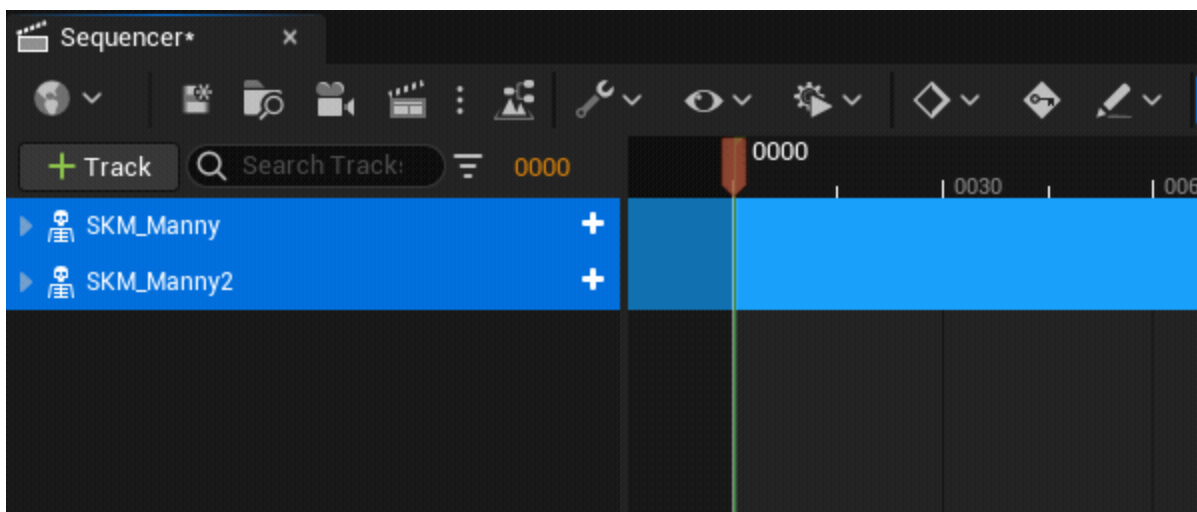

The most common way to create a Folder track is by clicking **Add Track (+)** in Sequencer and selecting **Add Folder**.

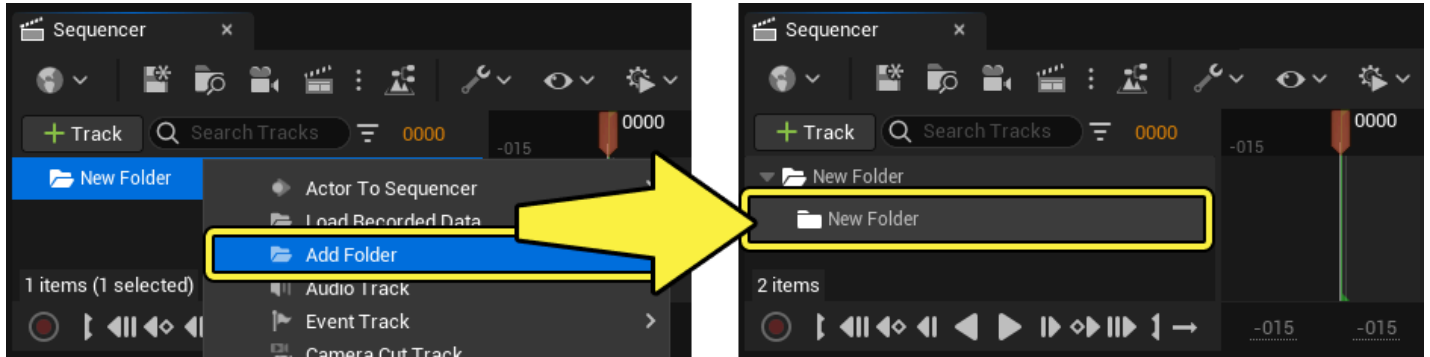

Folders can also be created by right-clicking a single or group of tracks and selecting **Move to Folder > New Folder**. Doing this will create a new Folder track and move the selected tracks under it.

You can also select one or several tracks and press **Ctrl + G** on your keyboard. This will create a new folder and move the selected tracks under it.

Right-clicking a folder and selecting **Add Folder** will also create a subfolder on that Folder track.

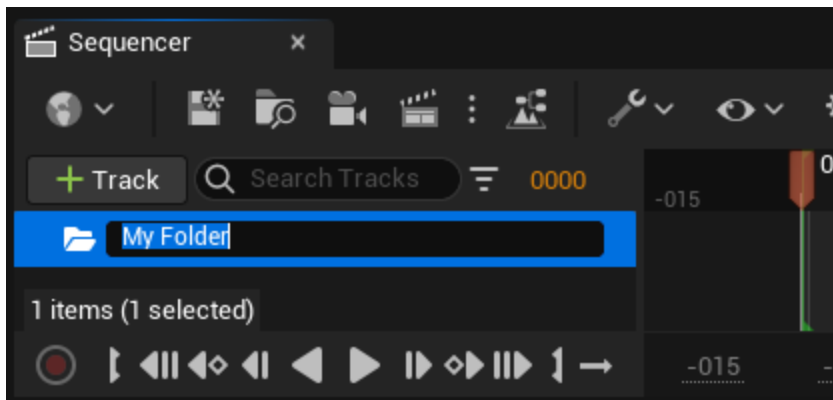

Usage

Folder Tracks support a wide range of intuitive movement and organization operations.

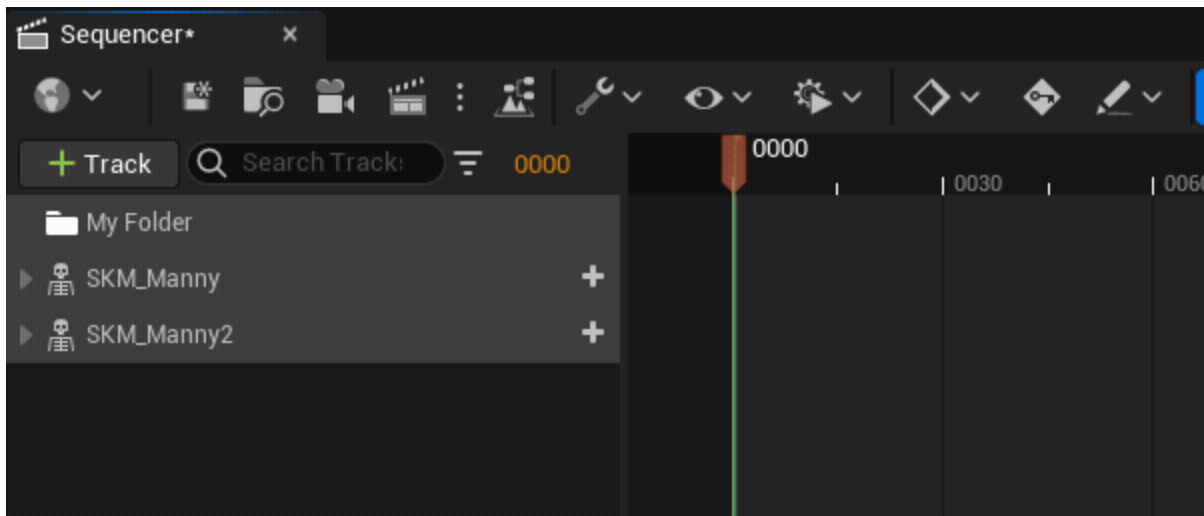

Renaming

Like most top-level tracks, folders can be renamed by triple-clicking the track text, by right-clicking and selecting **Rename**, or by pressing **F2**.

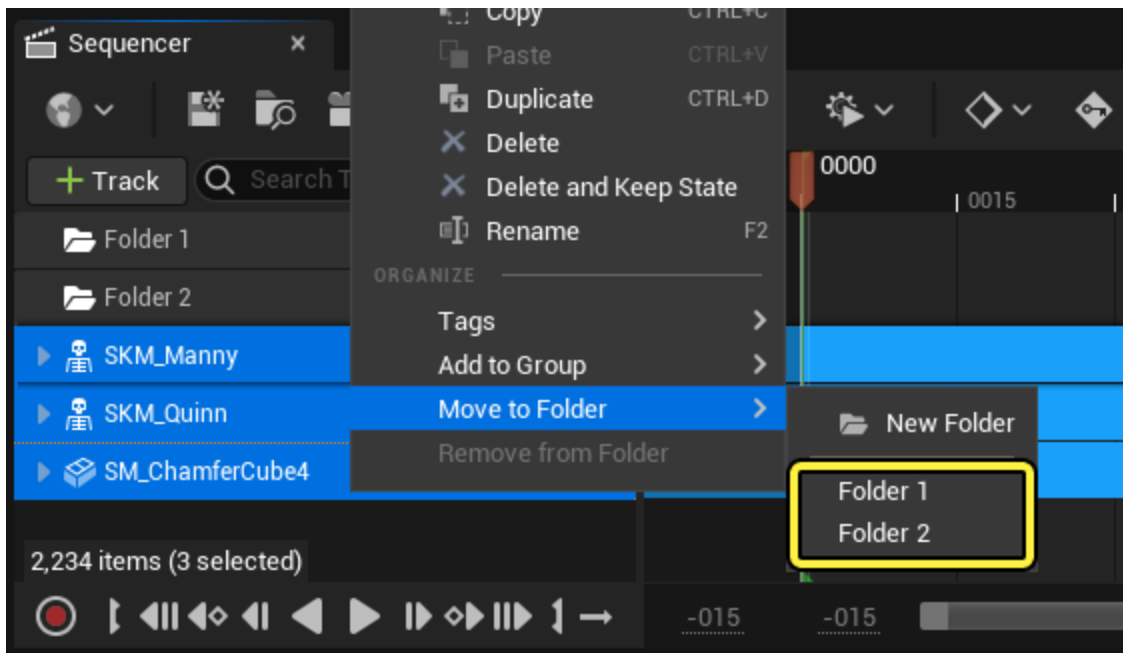

Add to Folder

Tracks can be added to folders by dragging them onto a folder in the Sequencer Outliner.

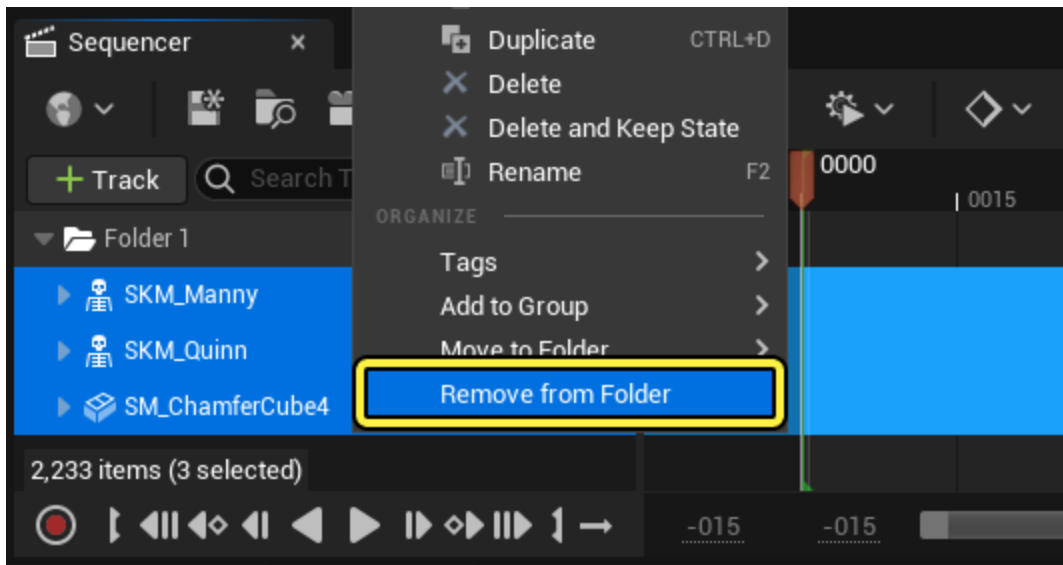

They can also be added to any currently existing folders by right-clicking them and selecting the folder from the **Move to Folder** menu.

Remove from Folder

Tracks can be removed from folders by right-clicking them and selecting **Remove from Folder**.

Setting Folder Color

You can apply colors to each Folder track's icon to distinguish them from one another.

To do this, right-click the folder and select **Set Color**. A Color Picker window will appear from which you can select your color. Once a color is selected, click the **OK** button and your folder icon will be updated with the selected color .
